Manuscript approved for publication September 1, 1972
System identification has been defined as the process of determining a difference or differential equation such that it describes a physical process in accordance with some predetermined criterion (Sage and Melza 1971). One should not, however, restrict it to physical processes, as many of the same principles apply to biological and social processes as well. In fact, system identification is an integral part of systems analysis, and solving the system identification problem may be viewed as one step toward the construction, testing, and analysis of mathematical characterizations of system processes. For an application of system identification concepts to the study of forest dynamics see Leary (1970).

One approach to the system identification problem (others are discussed by Sage and Melza 1971) is to treat observations on a system as the boundary conditions governing the solution of a functional equation. Often-used functional equation types are first-order ordinary differential or difference equations. We can limit ourselves to first-order equations because any higher-order linear or nonlinear differential or difference equation may be converted to a system of simultaneous first-order equations. In most instances the only practical method of solving the resultant boundary-value problem is to use digital or hybrid (for continuous systems) computers. Generalized digital computer programs have been written to solve nonlinear multipoint boundary-value problems (Childs et al. 1969, Leary and Skog); however, the uninitiated are often unable to grasp the sequence of operations involved in the programs, and therefore unable to make efficient use of them. The purpose of this paper is to provide the reader with a better understanding of the methods involved so he can make better use of the available programs. We do this by presenting two step-by-step hand-computed solutions to a simplified problem using a computational strategy developed by the author and the particular solutions perturbation method (Childs et al. 1969).

We use these two methods for solving the same problem because they are implemented by available computer programs; also, we want to make it clear that one method is not necessarily better than the other but that it is the

formulation of the problem as a multipoint boundary-value problem that is important. Exactly how one solves the boundary-value problem is not crucial, because the results are identical. The problem that follows is, in fact, a simple two-point boundary-value problem. Meaningful problems will ordinarily be higher dimensional (>2) with several boundary conditions.

THE PROBLEM

The problem is hypothetical, chosen to minimize the hand computations. Briefly it is as follows: Assume the process of concern is thought to be governed by the set of first-order difference equations:

\[ \frac{\Delta Y_1}{\Delta t} = a_{11} Y_1 + a_{12} Y_2 \]

\[ \frac{\Delta Y_2}{\Delta t} = a_{21} Y_1 + a_{22} Y_2 \]

where

\[ \Delta Y_1/\Delta t = (Y_1(t+k) - Y_1(t))/((t+k) - t), \]

\[ \Delta Y_2/\Delta t = (Y_1(t+k) - Y_1(t))/((t+k) - t), \]

\[ Y_1(t=0) = 1, Y_1(t=1) = 4.4 \]

\[ Y_2(t=0) = 4, Y_2(t=1) = 5.6 . \]

To solve this problem we formulate it as a two-point boundary-value problem as follows:

EQUATION 1.

\[ \frac{\Delta Y_1}{\Delta t} = Y_3 Y_1 + (.75) Y_2 \]

\[ \frac{\Delta Y_2}{\Delta t} = Y_4 Y_1 + (.25) Y_2 \]

\[ \Delta Y_3/\Delta t = 0 \]

\[ \Delta Y_4/\Delta t = 0 \]

with boundary conditions:

EQUATION 2.

\[ Y_1(t=0) = 1, Y_1(t=1) = 4.4 \]

\[ Y_2(t=0) = 4, Y_2(t=1) = 5.6 . \]
Clearly, the problem is to find initial conditions for $Y_3$ and $Y_4$ such that the boundary conditions are satisfied. Equation 1 with the conditions in Equation 2 is a nonlinear boundary-value problem.

### TWO STRATEGIES FOR SOLUTION

Not all nonlinear two-point or multipoint boundary-value problems are solvable. But many meaningful ones can be solved using the strategies outlined in this section. Strategy One is a variation of the method known as the method of complementary functions, and Strategy Two is the method of particular solutions (Childs et al. 1969). The essential difference between the two methods concerns the form of the linear equation for which solutions are computed. The method of complementary functions utilizes solutions of both the nonhomogeneous and homogeneous forms of the linear equation. The method of particular solutions uses solutions of the nonhomogeneous equation only. The two strategies are therefore related and have several common operations, as follows:

<table>

---

2/ For a discussion of superposition of homogeneous and nonhomogeneous solutions of differential equations see any basic textbook; e.g., Martin and Reissner (1961), and Bellman (1968). For difference equations consult Goldberg (1961, page 123).
Strategy One

Strategy One is patterned after Baird (1969) and may be described by the following recurrence relations:

\[ Y^N_K(t) = f(Y^N_K,t) \quad , \quad Y^N_K(t_o) = Y^N_{LS}(t_o) \]

\[ Y^L_K(t) = f(Y^L_K,t) + J[Y^N_K,t](Y^L_K-Y^N_K) \quad , \quad Y^L_K(t_o) = Y^L_{I} \]

where

\[ Y = \Delta Y/\Delta t \]

K is the iteration count,

N denotes the nonlinear equations,

L denotes the linear equations,

J is the Jacobian matrix at time t,

\[ Y^0_N(t_o) = Y^0_{II} \]

\[ Y^0_{II} \] is a constant matrix of initial conditions, the best estimates of unknown i.c., exact values of known i.c., and specified i.c. for solution of the homogeneous equations, and

\[ Y^0_{LS}(t_o) \] is the initial condition vector formed by superposition of one particular solution and one or more homogeneous solutions.

Column 1 of \[ Y^0_{II} \] contains the initial conditions governing the solution of the nonhomogeneous form of Equation 4. \[ Y^0_{I2} \] contains the initial conditions governing the first solution of the homogeneous form of Equation 4. Subsequent columns govern subsequent homogeneous solutions.

This strategy is different from the one usually employed in the method of complementary functions in that the initial conditions for the particular solution of Equation 4 do not change from one iteration (value of K) to the next. The primary advantage of this approach is that it minimizes relative error growth during execution of the algorithm.

The integration constants used in superposition are determined so that the boundary conditions are satisfied; i.e., by solving the system of algebraic equations:
\[ y_{1c}(t_i) = y_{1p}(t_i) + c_1 y_{1h}(t_i) + c_2 y_{2h}(t_i) = BC1(t_i) \] and
\[ y_{2c}(t_i) = y_{2p}(t_i) + c_1 y_{2h}(t_i) + c_2 y_{2h}(t_i) = BC2(t_i), \]
where \( c \) denotes the complete solution of the linearized equation.

The operation at Step 1 for the method of complementary functions requires that we prepare the basic nonlinear system, the nonhomogeneous form of the linearized equation, and as many homogeneous forms of the linearized equations as there are unknown initial conditions. Using the notational convention \( \Delta Y_i = \Delta Y_i/\Delta t \) (the first forward difference) we have:

\[
\begin{align*}
\Delta Y_1 &= Y_3 Y_1 + (.75)Y_2 = f_1 \\
\Delta Y_2 &= Y_4 Y_1 + (.25)Y_2 = f_2 \\
\Delta Y_3 &= 0 = f_3 \\
\Delta Y_4 &= 0 = f_4 \\
\Delta Y_5 &= Y_3 Y_1 + (.75)Y_2 \\
\Delta Y_6 &= Y_4 Y_1 + (.25)Y_2 \\
\Delta Y_7 &= 0 \\
\Delta Y_8 &= 0 \\
\Delta Y_9 &= Y_9 \\
\Delta Y_{10} &= Y_{10} \\
\Delta Y_{11} &= Y_{11} \\
\Delta Y_{12} &= Y_{12} \\
\Delta Y_{13} &= Y_{13} \\
\Delta Y_{14} &= Y_{14} \\
\Delta Y_{15} &= Y_{15} \\
\Delta Y_{16} &= Y_{16}
\end{align*}
\]
In the above system of 16 equations, the first four constitute the nonlinear system, the next four the nonhomogeneous form of the linearized equation, and the last eight the homogeneous form of the linearized equation. As will be clear later, the solutions of 9 to 12 and 13 to 16 above will differ because of different initial conditions. They should in fact be linearly independent to prevent ill-conditioning in the system of linear algebraic equations that is solved for the integration constants.

We are ready to begin Step 2. Let us use as initial estimates for the initial conditions on \( Y_3 \) and \( Y_4 \) the values 0.5 and 0.5; to ensure independence of homogeneous solutions we purposely choose \( Y_{11} = 1, Y_{12} = 0, \) and \( Y_{15} = 0, Y_{16} = 1. \) Iteration 1 follows:

**Step 2:** Set i.c. for functional equations

<table>
<thead>
<tr>
<th>( Y_i(0) )</th>
<th>( \Delta Y_i )</th>
<th>( Y_i(t=1) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( Y_1(0) = 1.0 )</td>
<td>( \Delta Y_1 = 3.5 )</td>
<td>( Y_1(t=1) = 4.5 )</td>
</tr>
<tr>
<td>( Y_2(0) = 4.0 )</td>
<td>( \Delta Y_2 = 1.5 )</td>
<td>( Y_2(1) = 5.5 )</td>
</tr>
<tr>
<td>( Y_3(0) = 0.5 )</td>
<td>( \Delta Y_3 = 0 )</td>
<td>( Y_3(1) = 0.5 )</td>
</tr>
<tr>
<td>( Y_4(0) = 0.5 )</td>
<td>( \Delta Y_4 = 0 )</td>
<td>( Y_4(1) = 0.5 )</td>
</tr>
<tr>
<td>( Y_5(0) = 1.0 )</td>
<td>( \Delta Y_5 = 3.5 )</td>
<td>( Y_5(1) = 4.5 )</td>
</tr>
<tr>
<td>( Y_6(0) = 4.0 )</td>
<td>( \Delta Y_6 = 1.5 )</td>
<td>( Y_6(1) = 5.5 )</td>
</tr>
<tr>
<td>( Y_7(0) = 0.5 )</td>
<td>( \Delta Y_7 = 0 )</td>
<td>( Y_7(1) = 0.5 )</td>
</tr>
<tr>
<td>( Y_8(0) = 0.5 )</td>
<td>( \Delta Y_8 = 0 )</td>
<td>( Y_8(1) = 0.5 )</td>
</tr>
<tr>
<td>( Y_9(0) = 0 )</td>
<td>( \Delta Y_9 = 1.0 )</td>
<td>( Y_9(1) = 1.0 )</td>
</tr>
<tr>
<td>( Y_{10}(0) = 0 )</td>
<td>( \Delta Y_{10} = 0 )</td>
<td>( Y_{10}(1) = 0 )</td>
</tr>
<tr>
<td>( Y_{11}(0) = 1.0 )</td>
<td>( \Delta Y_{11} = 0 )</td>
<td>( Y_{11}(1) = 1.0 )</td>
</tr>
<tr>
<td>( Y_{12}(0) = 0 )</td>
<td>( \Delta Y_{12} = 0 )</td>
<td>( Y_{12}(1) = 0 )</td>
</tr>
<tr>
<td>( Y_{13}(0) = 0 )</td>
<td>( \Delta Y_{13} = 0 )</td>
<td>( Y_{13}(1) = 0 )</td>
</tr>
<tr>
<td>( Y_{14}(0) = 0 )</td>
<td>( \Delta Y_{14} = 1.0 )</td>
<td>( Y_{14}(1) = 1.0 )</td>
</tr>
<tr>
<td>( Y_{15}(0) = 0 )</td>
<td>( \Delta Y_{15} = 0 )</td>
<td>( Y_{15}(1) = 0 )</td>
</tr>
<tr>
<td>( Y_{16}(0) = 1.0 )</td>
<td>( \Delta Y_{16} = 0 )</td>
<td>( Y_{16}(1) = 1.0 )</td>
</tr>
</tbody>
</table>
Clearly,
\[
\Delta l_4 = (\frac{\partial f_2}{\partial y_1})Y_{13} + (\frac{\partial f_2}{\partial y_2})Y_{14} + (\frac{\partial f_2}{\partial y_3})Y_{15} + (\frac{\partial f_2}{\partial y_4})Y_{16}
\]
\[
= Y_4 Y_{13} + 0.25 Y_{14} + 0 Y_{15} + Y_1 Y_{16}
\]
\[
= 0.5(0) + 0.25(0) + 0(0) + 1(1) = 1
\]

**Step 4:** Solve for integration constants so boundary conditions are satisfied.

<table>
<thead>
<tr>
<th>Time</th>
<th>Particular</th>
<th>First homogeneous</th>
<th>Second homogeneous</th>
<th>Boundary conditions (observation)</th>
</tr>
</thead>
</table>
| 0    | \[
Y_5 = 1 \\
Y_6 = 4
\] + c_1 | \[
Y_9 = 0 \\
Y_{10} = 0
\] + c_2 | \[
Y_{13} = 0 \\
Y_{14} = 0
\] | 1.0 |
| 1    | \[
Y_5 = 4.5 \\
Y_6 = 5.5
\] + c_1 | \[
Y_9 = 1 \\
Y_{10} = 0
\] + c_2 | \[
Y_{13} = 0 \\
Y_{14} = 1
\] | 4.4 |

This simplifies to
\[
c_1 \begin{bmatrix} 1 \\ 0 \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ 1 \end{bmatrix} = \begin{bmatrix} -0.1 \\ 0.1 \end{bmatrix} \quad \text{or} \quad c_1 = -0.1, \quad c_2 = 0.1
\]

**Step 5:** Form new initial conditions for the linearized equations using the superposition principle; i.e.,

\[
\begin{align*}
Y_5(t=0) &= 1.0 \\
Y_6(t=0) &= 4.0 + (c_1 = -0.1)
\end{align*}
\]

Then check for convergence by comparing initial conditions at successive iterations; i.e., compare \(Y_{LS}^K(t_0)\) and \(Y_{LS}^{K-1}(t_0)\). When \(K=1\), the comparison is between \(Y_{LS}^1(t_0)\) and \(Y_1\). Thus, our comparison is:
Clearly, convergence has not occurred.

**Step 6:** According to Equation 3, the initial conditions governing the solution of the nonlinear equations at the start of iteration 2 are given by $Y_{iS}(t_0)$, the result from Step 5. Thus, in iteration 2 which follows, the initial conditions for $Y_3$ and $Y_4$ are 0.4 and 0.6, respectively.

**Step 2:** Set i.c., for functional equations

**Step 3:** Solve functional equations, i.e., evaluate equations 1-16 and add to i.c.

- $Y_1(0) = 1.0$  \( \Delta Y_1 = 3.4 \)  \( Y_1(1) = 4.4 \)
- $Y_2(0) = 4.0$  \( \Delta Y_2 = 1.6 \)  \( Y_2(1) = 5.6 \)
- $Y_3(0) = 0.4$ from Iteration 1  \( \Delta Y_3 = 0 \)  \( Y_3(1) = 0.4 \)
- $Y_4(0) = 0.6$ from Iteration 1  \( \Delta Y_4 = 0 \)  \( Y_4(1) = 0.6 \)
- $Y_5(0) = 1.0$  \( \Delta Y_5 = 3.5 \)  \( Y_5(1) = 4.5 \)
- $Y_6(0) = 4.0$  \( \Delta Y_6 = 1.5 \)  \( Y_6(1) = 5.5 \)
- $Y_7(0) = 0.5$ initial estimates  \( \Delta Y_7 = 0 \)  \( Y_7(1) = 0.5 \)
- $Y_8(0) = 0.5$ initial estimates  \( \Delta Y_8 = 0 \)  \( Y_8(1) = 0.5 \)
- $Y_9(0) = 0$  \( \Delta Y_9 = 1.0 \)  \( Y_9(1) = 1.0 \)
- $Y_{10}(0) = 0$  \( \Delta Y_{10} = 0 \)  \( Y_{10}(1) = 0 \)
- $Y_{11}(0) = 1.0$  \( \Delta Y_{11} = 0 \)  \( Y_{11}(1) = 1.0 \)
- $Y_{12}(0) = 0$  \( \Delta Y_{12} = 0 \)  \( Y_{12}(1) = 0 \)
- $Y_{13}(0) = 0$  \( \Delta Y_{13} = 0 \)  \( Y_{13}(1) = 0 \)
- $Y_{14}(0) = 0$  \( \Delta Y_{14} = 1.0 \)  \( Y_{14}(1) = 1.0 \)
- $Y_{15}(0) = 0$  \( \Delta Y_{15} = 0 \)  \( Y_{15}(1) = 0 \)
- $Y_{16}(0) = 1.0$  \( \Delta Y_{16} = 0 \)  \( Y_{16}(1) = 1.0 \)
Step 4: Solve for integration constants so boundary conditions are satisfied (from Iteration 1, Step 4, we see that conditions at \( t=0 \) do not affect the solution),

<table>
<thead>
<tr>
<th>Time</th>
<th>Particular</th>
<th>First homogeneous</th>
<th>Second homogeneous</th>
<th>Boundary conditions (observation)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>( Y_5 = 4.5 ) + ( Y_9 = 1 ) + ( Y_{10} = 0 )</td>
<td>( Y_{13} = 0 ) + ( Y_{14} = 1 )</td>
<td>( c_1 ), ( c_2 )</td>
<td>( Y_7 = 0.5 ) + ( Y_{11} = 1 )</td>
</tr>
</tbody>
</table>

\[
\begin{bmatrix}
1 \\
0
\end{bmatrix}
+ \begin{bmatrix}
0 \\
1
\end{bmatrix} = \begin{bmatrix}
-.1 \\
+.1
\end{bmatrix}, \text{ thus } c_1 = -.1, \quad c_2 = +.1
\]

Step 5: Form new initial conditions via superposition,

\[
\begin{align*}
Y_5(t=0) &= 1.0 \\
Y_6(t=0) &= 4.0 + (c_1 = -1) \\
Y_7(t=0) &= .5 \\
Y_8(t=0) &= .5 + (c_2 = .1)
\end{align*}
\]

and check for convergence by comparing results with those produced at Step 5 of the previous iteration; i.e., compare \( Y_{L_5}^{2}(t_0) \) and \( Y_{L_5}^{1}(t_0) \). Thus:

\[
\begin{bmatrix}
1.0 \\
4.0 \\
.4 \\
.6
\end{bmatrix}
\text{ vs. } \begin{bmatrix}
1.0 \\
4.0 \\
.4 \\
.6
\end{bmatrix}
\]

and we see that convergence has occurred.

We may conclude, therefore, that the following equations may be used to approximate the true equations governing the observed process:

\[
\frac{\Delta Y_1}{\Delta t} = (.4)Y_1 + (.75)Y_2
\]

\[
\frac{\Delta Y_2}{\Delta t} = (.6)Y_1 + (.25)Y_2
\]
Strategy Two

This computational strategy is taken from Childs et al. (1969), and may be described by the recurrence relations:

\[
\Delta Y_N^K(t) = f(Y_N^K, t) \quad , \quad Y_N^K(t_0) = Y_{LS}^{K-1}(t_0)
\]

\[
\Delta Y_L^K(t) = f(Y_N^K, t) + J[Y_N^K, t](Y_L^K - Y_N^K), \quad Y_L^K(t_0) = Y_{ij}
\]

where all notation is identical to that in Equations 3 and 4, and where

\( Y_{ij} \) is a nonconstant matrix of initial conditions, the first column of which contains the unperturbed initial conditions. Other columns contain initial conditions that have been perturbed, and

\( Y_{LS}(t_0) \) is the initial condition vector formed by superimposing (in this case) two perturbed particular solutions on one unperturbed solution.

The integration constants are determined by solving the system of algebraic equations:

\[
a_1 y_{1p}(t_i) + a_2 y_{2p}(t_i) + a_3 y_{3p}(t_i) = BCl(t_i)
\]

\[
a_1 y_{2p}(t_i) + a_2 y_{2p}(t_i) + a_3 y_{3p}(t_i) = BC2(t_i)
\]

\[
a_1 + a_2 + a_3 = 1
\]

for \( a_i, i=1,2,3 \). The third equation is a supplementary condition that the \( a_i \) must meet for this method.

The operation at Step 1 for the particular solutions perturbation method requires that we prepare the basic nonlinear system and (for this problem) three sets of the nonhomogeneous form of Equation 6. Thus we have:
\[ \Delta Y_1 = \begin{bmatrix} Y_3 Y_1 + (.75)Y_2 \end{bmatrix} = f_1 \]
\[ \Delta Y_2 = \begin{bmatrix} Y_4 Y_1 + (.25)Y_2 \end{bmatrix} = f_2 \]
\[ \Delta Y_3 = 0 = f_3 \]
\[ \Delta Y_4 = 0 = f_4 \]

\[ \Delta Y_5 = \begin{bmatrix} Y_3 Y_1 + (.75)Y_2 \end{bmatrix} + \begin{bmatrix} \frac{\partial f_1}{\partial Y_1} \end{bmatrix} \begin{bmatrix} Y_5 - Y_1 \end{bmatrix} \]
\[ \Delta Y_6 = \begin{bmatrix} Y_4 Y_1 + (.25)Y_2 \end{bmatrix} + \begin{bmatrix} \frac{\partial f_2}{\partial Y_1} \end{bmatrix} \begin{bmatrix} Y_6 - Y_2 \end{bmatrix} \]
\[ \Delta Y_7 = 0 = \begin{bmatrix} \frac{\partial f_3}{\partial Y_1} \end{bmatrix} \begin{bmatrix} Y_7 - Y_3 \end{bmatrix} \]
\[ \Delta Y_8 = 0 = \begin{bmatrix} \frac{\partial f_4}{\partial Y_1} \end{bmatrix} \begin{bmatrix} Y_8 - Y_4 \end{bmatrix} \]

The first four equations above constitute the nonlinear system. Equations 5 to 8, 9 to 12, and 13 to 16 are nonhomogeneous forms of the linearized equations. The solution of these three sets may be expected to differ because of different initial conditions and should be linearly independent.

We are now ready to begin Step 2. Notice that we again estimate the unknown initial conditions on \( Y_3 \) and \( Y_4 \) as 0.5. Notice also that the initial conditions for \( Y_{11} \) and \( Y_{16} \) are a constant multiple (in this case 1.2) of those for \( Y_3 \) and \( Y_4 \), respectively. Iteration 1 follows:
Step 2: Set i.c. for functional equations

<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Step 3: Solve functional equations; i.e., evaluate equations 1-16 and add to i.c. to give \( Y_i(t=1) \)

<table>
<thead>
<tr>
<th>i</th>
<th>( \Delta Y_i )</th>
<th>( Y_i(t=1) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y1</td>
<td>3.5</td>
<td>4.5</td>
</tr>
<tr>
<td>Y2</td>
<td>1.5</td>
<td>5.5</td>
</tr>
<tr>
<td>Y3</td>
<td>0</td>
<td>.5</td>
</tr>
<tr>
<td>Y4</td>
<td>0</td>
<td>.5</td>
</tr>
<tr>
<td>Y5</td>
<td>3.5</td>
<td>4.5</td>
</tr>
<tr>
<td>Y6</td>
<td>1.5</td>
<td>5.5</td>
</tr>
<tr>
<td>Y7</td>
<td>0</td>
<td>.5</td>
</tr>
<tr>
<td>Y8</td>
<td>0</td>
<td>.5</td>
</tr>
<tr>
<td>Y9</td>
<td>3.6</td>
<td>4.6</td>
</tr>
<tr>
<td>Y10</td>
<td>1.5</td>
<td>5.5</td>
</tr>
<tr>
<td>Y11</td>
<td>0</td>
<td>.6</td>
</tr>
<tr>
<td>Y12</td>
<td>0</td>
<td>.5</td>
</tr>
<tr>
<td>Y13</td>
<td>3.5</td>
<td>4.5</td>
</tr>
<tr>
<td>Y14</td>
<td>1.6</td>
<td>5.6</td>
</tr>
<tr>
<td>Y15</td>
<td>0</td>
<td>.5</td>
</tr>
<tr>
<td>Y16</td>
<td>0</td>
<td>.6</td>
</tr>
</tbody>
</table>

Step 4: Solve for integration constants so boundary conditions are satisfied.

Unperturbed  | First perturbed  | Second perturbed | Boundary conditions (observation)
-------------|------------------|------------------|-----------------------------------
\[ Y_5 = 4.5 \]  | \[ Y_9 = 4.6 \]  | \[ Y_{13} = 4.5 \]  | 4.4
a_1 [Y_6 = 5.5] + a_2 [Y_{10} = 5.5] + a_3 [Y_{14} = 5.6] = 5.6
\[ 1.0 \]  | \[ 1.0 \]  | \[ 1.0 \]  | 1.0

The solution is \( a_3 = 1 \), \( a_2 = -1 \), \( a_1 = 1 \).
Step 5: Check for convergence; i.e., are $a_2$ and $a_3$ very near zero? Because they are not we form new initial conditions via superposition; i.e.,

<table>
<thead>
<tr>
<th>$a_1=1$</th>
<th>$a_2=-1$</th>
<th>$a_3=1$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$Y_5(t=0)=1$</td>
<td>$Y_6(0)=4$</td>
<td>$Y_7(0)=0.5$</td>
</tr>
<tr>
<td>$Y_8(0)=0.5$</td>
<td>$Y_9(t=0)=1$</td>
<td>$Y_{10}(0)=4$</td>
</tr>
<tr>
<td>$Y_{11}(0)=0.6$</td>
<td>$Y_{12}(0)=0.5$</td>
<td>$Y_{13}(0)=1$</td>
</tr>
<tr>
<td>$Y_{14}(0)=4$</td>
<td>$Y_{15}(0)=0.5$</td>
<td>$Y_{16}(0)=0.6$</td>
</tr>
<tr>
<td>$Y_{17}(0)=0$</td>
<td>$Y_{18}(0)=0.5$</td>
<td></td>
</tr>
</tbody>
</table>

and start Iteration 2.

Step 2: Set i.c. for functional equations

| $Y_1(t=0)$ | $Y_2(t=0)$ | $Y_3(t=0)$ | $Y_4(t=0)$ | $Y_5(t=0)$ | $Y_6(t=0)$ | $Y_7(t=0)$ | $Y_8(t=0)$ | $Y_9(t=0)$ | $Y_{10}(t=0)$ | $Y_{11}(t=0)$ | $Y_{12}(t=0)$ | $Y_{13}(t=0)$ | $Y_{14}(t=0)$ | $Y_{15}(t=0)$ | $Y_{16}(t=0)$ |
|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| 1.0        | 4.0        | 0.4        | 0.6        | 1.0        | 4.0        | 0.4        | 0.6        | 1.0        | 4.0        | 0.4        | 0.6        | 1.0        | 4.0        | 0.4        | 0.6        |

Step 3: Solve functional equations

<table>
<thead>
<tr>
<th>$ΔY_1 = 3.4$</th>
<th>$ΔY_2 = 1.6$</th>
<th>$ΔY_3 = 0$</th>
<th>$ΔY_4 = 0$</th>
<th>$ΔY_5 = 3.4$</th>
<th>$ΔY_6 = 1.6$</th>
<th>$ΔY_7 = 0$</th>
<th>$ΔY_8 = 0$</th>
<th>$ΔY_9 = 3.4 + 0.08 = 3.48$</th>
<th>$ΔY_{10} = 1.6 + 0 = 1.6$</th>
<th>$ΔY_{11} = 0$</th>
<th>$ΔY_{12} = 0$</th>
<th>$ΔY_{13} = 3.4 + 0 = 3.4$</th>
<th>$ΔY_{14} = 1.6 + 0.12 = 1.72$</th>
<th>$ΔY_{15} = 0$</th>
<th>$ΔY_{16} = 0$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$Y_1(t=1) = 4.4$</td>
<td>$Y_2(1) = 5.6$</td>
<td>$Y_3(1) = 0.4$</td>
<td>$Y_4(1) = 0.6$</td>
<td>$Y_5(1) = 4.4$</td>
<td>$Y_6(1) = 5.6$</td>
<td>$Y_7(1) = 0.4$</td>
<td>$Y_8(1) = 0.6$</td>
<td>$Y_9(1) = 4.48$</td>
<td>$Y_{10}(1) = 5.6$</td>
<td>$Y_{11}(1) = 0.48$</td>
<td>$Y_{12}(1) = 0.6$</td>
<td>$Y_{13}(1) = 4.4$</td>
<td>$Y_{14}(1) = 5.72$</td>
<td>$Y_{15}(1) = 0.4$</td>
<td>$Y_{16}(1) = 0.72$</td>
</tr>
</tbody>
</table>
Step 4: Solve for integration constants so boundary conditions are satisfied

\[
\begin{align*}
4.4 & \quad 4.48 & \quad 4.4 & \quad 4.4 \\
5.6 + a_2 & \quad 5.6 + a_3 & \quad 5.72 & = 5.6 \\
1.0 & \quad 1.0 & \quad 1.0 & \quad 1.0
\end{align*}
\]

The solution is \( a_1 = 1 \), \( a_2 = 0 \), and \( a_3 = 0 \).

Step 5: Check for convergence. Clearly, since \( a_2 = a_3 = 0 \), convergence has occurred.

In this case also we conclude that the following equations may be used to approximate the process that was observed:

\[
\begin{align*}
\Delta Y_1/\Delta t &= (.4) Y_1 + (.75) Y_2 \\
\Delta Y_2/\Delta t &= (.6) Y_1 + (.25) Y_2
\end{align*}
\]

DISCUSSION

It is clear that by following the steps outlined previously we have obtained convergence in both cases in 2 iterations. Furthermore, convergence is to the same values, as we asserted earlier. Thus both computational strategies, for which there are available digital computer programs, are suited to solve this two-point boundary-value problem.

There are at least two points that appear to warrant some discussion. First, the example selected was extremely simple and probably could be solved by other means. We would like to emphasize that the procedures used for this example apply virtually unaltered to problems that are orders of magnitude more complex; e.g., for time-dependent coefficients (nonstationary processes), "missing observation" situations, unobservable state variables, etc. For several worked examples see Leary and Skog (1972).

Second, the computational strategies employed here compare favorably with other methods of solving nonlinear boundary-value problems such as quasi-linearization, and provide an efficient method of solving a variety of meaningful problems.
SOME RECENT PUBLICATIONS
OF THE
NORTH CENTRAL FOREST EXPERIMENT STATION

ABOUT THE FOREST SERVICE

As our Nation grows, people expect and need more from their forests — more wood; more water, fish, and wildlife; more recreation and natural beauty; more special forest products and forage. The Forest Service of the U.S. Department of Agriculture helps to fulfill these expectations and needs through three major activities:

- Conducting forest and range research at over 75 locations ranging from Puerto Rico to Alaska to Hawaii.
- Participating with all State forestry agencies in cooperative programs to protect, improve, and wisely use our Country's 395 million acres of State, local, and private forest lands.
- Managing and protecting the 187-million acre National Forest System.

The Forest Service does this by encouraging use of the new knowledge that research scientists develop; by setting an example in managing, under sustained yield, the National Forests and Grasslands for multiple use purposes; and by cooperating with all States and with private citizens in their efforts to achieve better management, protection, and use of forest resources.

Traditionally, Forest Service people have been active members of the communities and towns in which they live and work. They strive to secure for all, continuous benefits from the Country's forest resources.

For more than 60 years, the Forest Service has been serving the Nation as a leading natural resource conservation agency.
